

# Load Tester

Install. Test. Report.

Load Tester is designed to test the capacity of new and existing hardware setups. Load Tester simulates Content Manager client requests and reports on the number of client requests per second the hardware setup is able to support.

Load Tester simulates routine tasks that any user might carry out within Content Manager such as: title word searches, document super copy, and adding a new document. Load Tester completes these tasks via simultaneous separate connections to the server until the server is maxed out, reliably testing the load a server is able to support.

This handy tool helps organisations ensure their systems can handle the traffic generated through normal daily use or during increased activity such as data migrations.

## Installation

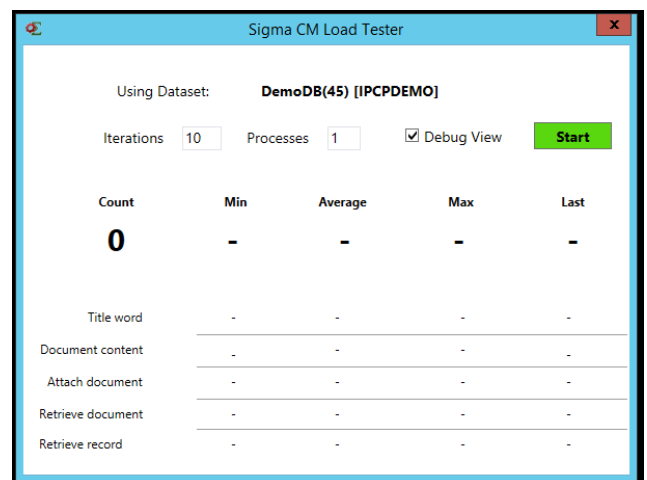

Load Tester doesn't require any installation, just simply unzip and run!

## Compatibility

Compatible with all Microsoft Windows versions and can be used to test CM & RM. The load tester is designed to be run from a machine that is not the CM server.

## Support

Our standard software support agreement includes access to the support help desk and new versions of the product as they become available.

## How to Buy

For more information regarding Load Tester, or to arrange a product demonstration or quotation, please contact Sigma Data Solutions: Ph: +61 8 6230 2213 or email [sales@sigmadata.com.au](mailto:sales@sigmadata.com.au).
